REMARKS: RUN NUMBER 1

Hole U1309D was originally drilled during ODP Leg 304 in 2004 and deepened during Leg 305 in 2005.
Log data recorded on expeditions 304 and 305 provides sonic measurements to approximately 2450mbrf.
After the first run in hole on this expedition, it was discovered that the MCD centralizer arms suffered
extreme wear, so to avoid this problem on the DSI run, the pipe was lowered to 2356mbrf and only the
lower section of the hole where sonic data had not previously been recorded was logged.
Logs were correlated to the "Dual−Laterolog Tool" log recorded by Schlumberger on 31 JAN 05.
The DSI was run with the following modes:
Upper Dipole in Standard Frequency (Odd Receiver Array)
Lower Dipole in Standard Frequency (Even Receiver Array)
Stoneley (Even)
Monopole P&S in Standard Frequency (Odd array, DDBHC mode)
Both Cross Dipole (BCR)
Tools hung up on an apparent ledge at 3043m; up log was recorded from that depth.
Dipole STC processing windows adjusted to 60uS to 360uS range at client request based on down−log observations.
Downlog flipped and reprocessed using same processing parameters as uplog in lieu of a repeat pass to prevent centralizer wear.
